Designing our app - fundamentals are important

Video - Pyramid builders

Minions (2015) Pyramid

Minions Pyramid Builders - Source: YouTube

Data considerations in mobile apps

- worked our way through Cordova's File plugin
- tested local and remote requests with JSON
- initial considerations for working with LocalStorage
- many other options for data storage in mobile applications
 - *IndexedDB*
 - *hosted NoSQL options, such as Redis and MongoDB*
 - *Firebase*
 - *query hosted remote SQL databases*
 - *and so on...*

Image - Data Tester

DATA TEST - STORAGE API

CORDOVA STORAGE TEST

A QUICK TEST OF LOCAL PERSISTENT DATA STORAGE IN CORDOVA.

NOTE TITLE

NOTE CONTENT

NOTE SAVED...

DataTestI - save a note

Cordova app - LocalStorage - data test

app logic - save.js

- need to handle events for our `reloadNote` button
- retrieve our notes data
 - loaded by calling the `reloadNoteData()` function
- uses the main app object, `storageNotes`
 - gets the defined key for our notes
- use this key to retrieve stored *stringified* JSON object
- then use `JSON.parse()` to convert the *stringified* object to a plain JSON object
 - contains our note information
- use this note information
 - populate form fields
 - output our notes for rendering to the DOM

Cordova app - LocalStorage - data test

app logic - save.js - reload button handler

- event handler for reload button

```
// handler for reload note button
$("#reloadNote").on("tap", function(e) {
    e.preventDefault();
    reloadNoteData();
    $("#saveResult").html("note reloaded...");
});
```

- reload note data

```
function reloadNoteData() {
    var noteInfo = JSON.parse(storageNotes.get(NOTE_KEY));
    loadFormFields(noteInfo);
    noteOutput(noteInfo);
}
```

- load form fields data

```
function loadFormFields(data) {
    if (data) {
        $("#noteName").val(data.noteName);
        $("#noteContent").val(data.noteContent);
    }
}
```

Cordova app - LocalStorage - data test

app logic - save.js

- pageinit event
 - *eg: check and validate the rendered form for our notes*
- to validate our form we specify
 - *a set of options as a parameter to `validate()`*
 - *many different options available*
 - *eg: add a `rules` object, `messages` object...*
- in the `rules` object
 - *set both input fields as required*
- then reload our note data
 - *update the application accordingly*

Cordova app - LocalStorage - data test

app logic - save.js - pageshow event

```
$("#noteForm").validate({
  rules: {
    noteName: "required",
    noteContent: "required"
  },
  messages: {
    noteName: "Add title for note",
    noteContent: "Add your note"
  }
});
```

Cordova app - LocalStorage - data test

app logic - storagenotes.js

- add another new JS file, `storagenotes.js`
 - *store the logic for getting and setting of data with `localStorage`*
- start by creating a singleton object for this instance
- creating this object to ensure that we only have one instance
- create this object by calling the `getInstance()` function
 - *in effect, the guardian to the instance object for the application*
- function also highlights a pattern known as `Lazy Load`
 - *checks to see if an instance has already been created*
- if not, create one and then store for future reference
- all subsequent calls will now received this stored reference
- this pattern is particularly useful for mobile development
- helps us save CPU and memory usage within an application
 - *an object is only created when it is actually needed*
- gives us a single object with getters and setters for the local storage

Cordova app - LocalStorage - data test

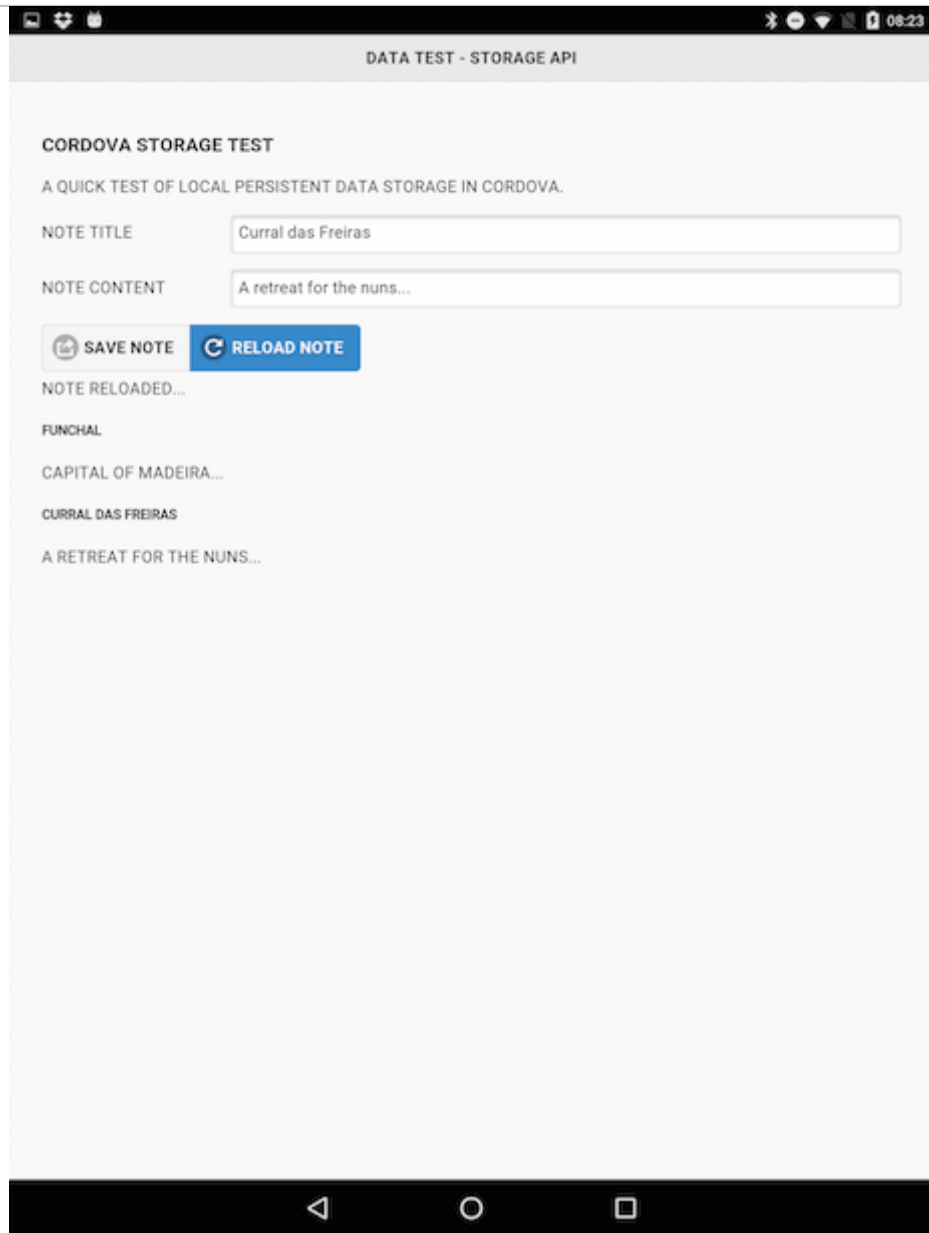

app logic - storagenotes.js

```
var NotesManager = (function () {
    var instance;

    function createNoteObject() {
        return {
            set: function (key, value) {
                window.localStorage.setItem(key, value);
            },
            get: function (key) {
                return window.localStorage.getItem(key);
            }
        };
    };

    return {
        getInstance: function () {
            if (!instance) {
                instance = createNoteObject();
            }
            return instance;
        }
    };
})();
```

Image - Data Tester

DataTestI - update the notes

Cordova app - IndexedDB

intro

- browser storage wars of recent years
 - *IndexedDB was crowned the winner over WebSQL*
- what do we gain with IndexedDB?
 - *useful option for developers to store relatively large amounts of client-side data*
 - *effectively stores data within the user's webview/browser*
 - *useful storage option for network apps*
 - *a powerful, and particularly useful, indexed based search API*
- IndexedDB differs from other local browser-based storage options
- localStorage is generally well supported
 - *limited in terms of the total amount of storage*
 - *no native search API*
- different solutions for different problems
 - *no universal best fit for storage...*
- browser support for mobile and desktop
 - *Can I use___?*
- Cordova plugin to help with IndexedDB support
 - *MSOpenTech - cordova-plugin-indexeddb*

Cordova app - IndexedDB - data test 2

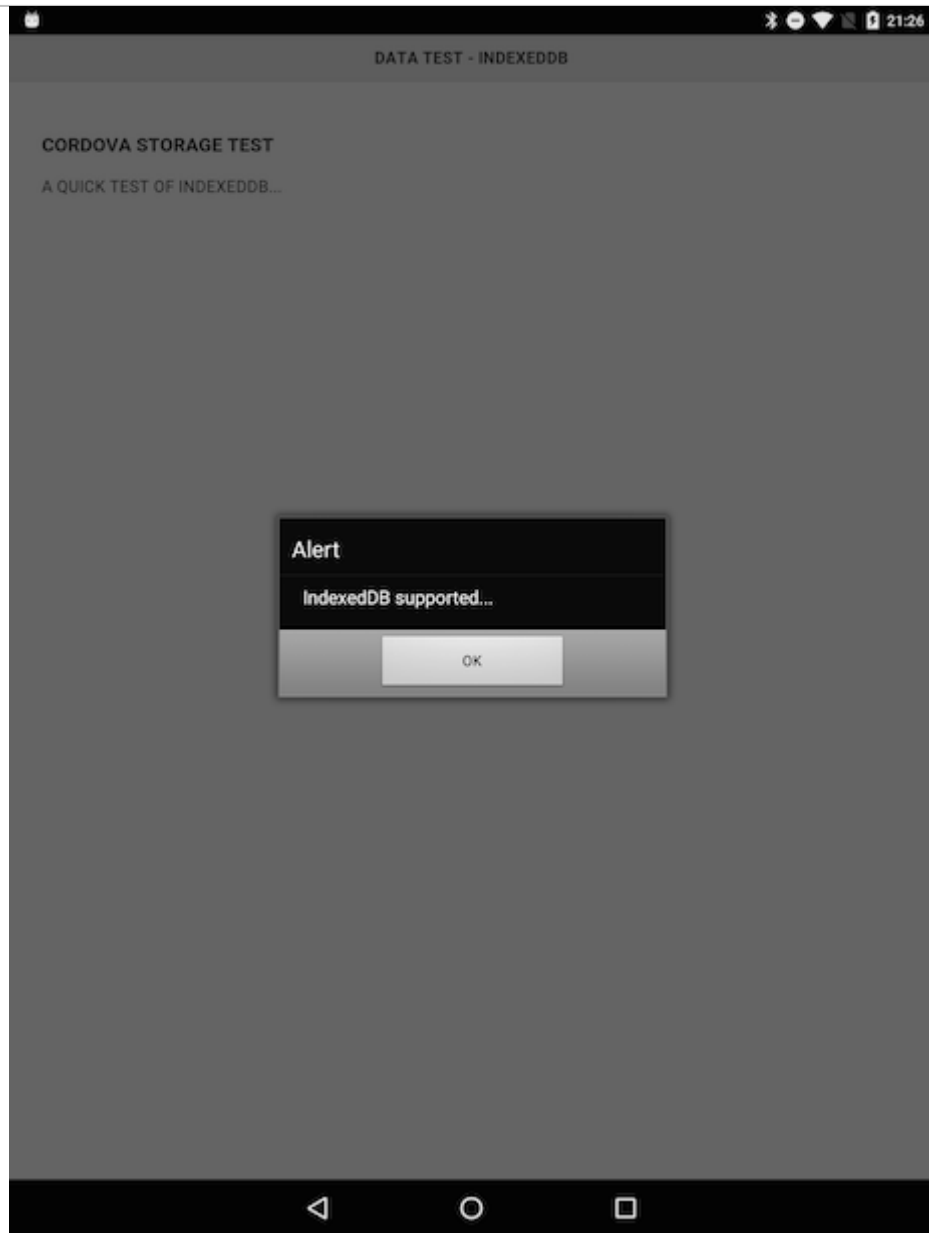

setup and test - part 1

- testing our IndexedDB example with Cordova and Android
- perform our standard test for the deviceready event
 - *going to add a check for IndexedDB support and usage*
- in `onDeviceReady()` function
 - *add a quick check for IndexedDB support in the application's webview*

```
if("indexedDB" in window) {  
    console.log("IndexedDB supported...");  
} else {  
    console.log("No support...");  
}
```

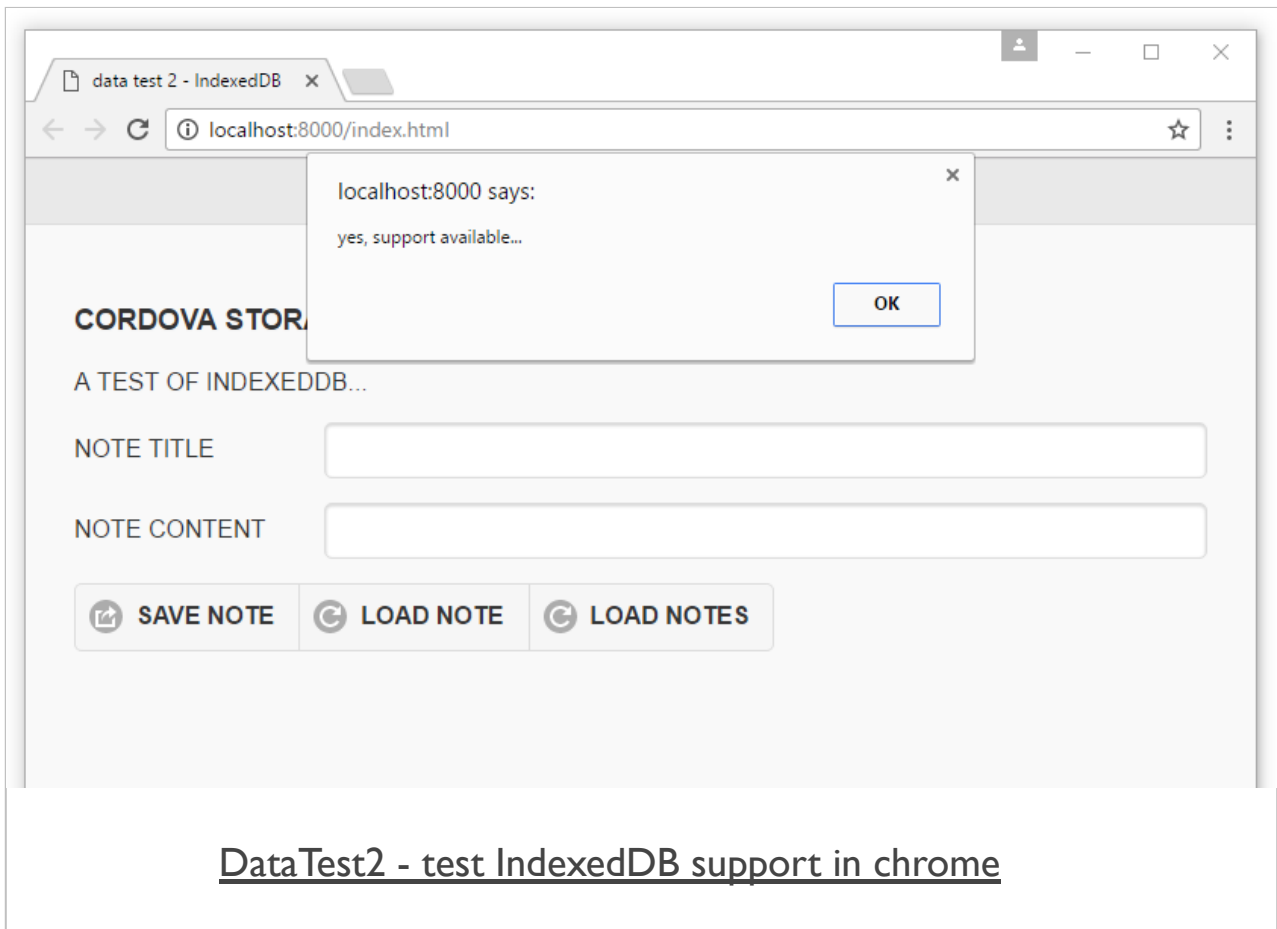

- Android support is available...

Image - IndexedDB Support

DataTest2 - test IndexedDB support in webview

Image - IndexedDB Support

Cordova app - IndexedDB - data test 2

setup and test - part 2

- update this check to ensure we have a quick reference later

```
//set variable for IndexedDB support
var indexedDBSupport = false;
//check IndexedDB support
if("indexedDB" in window) {
    indexedDBSupport = true;
    console.log("IndexedDB supported...");
} else {
    console.log("No support...");
}
```

- create initial variable to store the boolean result
- check variable after deviceready event has fired and returned successfully

Cordova app - IndexedDB - data test 2

database - part 1 - getting started

- start to build our IndexedDB database
- database is local to the browser,
 - *only available to users of the local, native app*
- IndexedDB databases follow familiar pattern of read and write privileges
 - *eg: browser-based storage options, including localStorage*
- create databases with the same name, and then deploy them to different apps
 - *remain domain specific as well*
- first thing we need to do is create an opening to our database

```
var openDB = indexedDB.open("422test", 1);
```

- creating a variable for our database connection
 - *specifying the name of the DB and a version*
- open request to the DB is an asynchronous operation

Cordova app - IndexedDB - data test 2

database - part 2 - getting started

- open request to the DB is an asynchronous operation
 - *add some useful event listeners to help with our application*
 - *success, error, upgradeneeded, `blocked`*
- upgradeneeded
 - *event will fire when the DB is first opened within our application*
 - *also if and when we update the version number for the DB*
- blocked
 - *fires when a previous or defunct connection to the DB has not been closed*

Cordova app - IndexedDB - data test 2

database - part 3 - create

- test creating a new DB
 - *then checking persistence during application loading and usage*

```
if(indexedDBSupport) {  
    var openDB = indexedDB.open("422test",1);  
    openDB.onupgradeneeded = function(e) {  
        console.log("DB upgrade...");  
    }  
    openDB.onsuccess = function(e) {  
        console.log("DB success...");  
        db = e.target.result;  
    }  
    openDB.onerror = function(e) {  
        console.log("DB error...");  
        console.dir(e);  
    }  
}
```

- `console.log()` - outputs a string representation
- `console.dir()` - prints a navigable tree

Image - IndexedDB Support

IndexedDB supported...	<u>plugin.js:15</u>
DB upgrade...	<u>plugin.js:25</u>
DB success...	<u>plugin.js:29</u>

DataTest2 - test IndexedDB open - first app load

Cordova app - IndexedDB - data test 2

database - part 4 - success

- performed a check to ensure that IndexedDB is supported
 - *if yes, open a connection to the DB*
 - *also added checks for three events, including upgrade, onsuccess, and errors*
- now ready to test the success event
 - *event is passed a handler via `target.result`*

```
...
openDB.onsuccess = function(e) {
    console.log("DB success...");
    db = e.target.result;
}
...
```

- handler is being stored in our global variable db
- run this test and check log output
 - *outputs initial connection and upgrade status*
 - *then the success output for subsequent loading of the application*

Image - IndexedDB Support

IndexedDB supported...

plugin.js:15

DB success...

plugin.js:29

DataTest2 - test IndexedDB open - after first app load

Cordova app - IndexedDB - data test 2

database - part 5 - data stores

- now start building our data stores in IndexedDB
- IndexedDB has a general concept for storing data
 - known as **Object Stores**
 - conceptually at least, known as (very) loose database tables
- within our object stores
 - add some data, plus a **keypath**, and an optional set of indices (indexes)
- a **keypath** is a unique identifier for the data
- Indices help us index and retrieve the data
- object stores created during upgradeneeded event for the current version
 - created when the app first loads
 - create object stores as part of this upgradeneeded event
- if we want to upgrade our object stores
 - update version
 - upgrade the object store using the upgradeneeded event

Cordova app - IndexedDB - data test 2

database - part 6 - data stores

- update our upgrade event to include the creation of our required object stores

```
...
openDB.onupgradeneeded = function(e) {
    console.log("DB upgrade...");
    //local var for db upgrade
    var upgradeDB = e.target.result;
    if (!upgradeDB.objectStoreNames.contains("422os")) {
        upgradeDB.createObjectStore("422os");
        console.log("new object store created...");
    }
}
...
```

- check a list of existing object stores
 - *list of existing object stores available in the property `objectStoreNames`*
- check this property for our required object store using the `contains` method
- if required object store unavailable we can create our new object store
 - *listen for result from this synchronous method*
- as a user opens our app for the first time
 - *the `upgradeneeded` event is run*
 - *code checks for an existing object store*
 - *if unavailable, create a new one*
 - *then run the `success` handler*

Image - IndexedDB Support

IndexedDB supported...	plugin.js:17
DB upgrade...	plugin.js:26
new object store created...	plugin.js:31
DB success...	plugin.js:35

DataTest2 - test IndexedDB - create object store

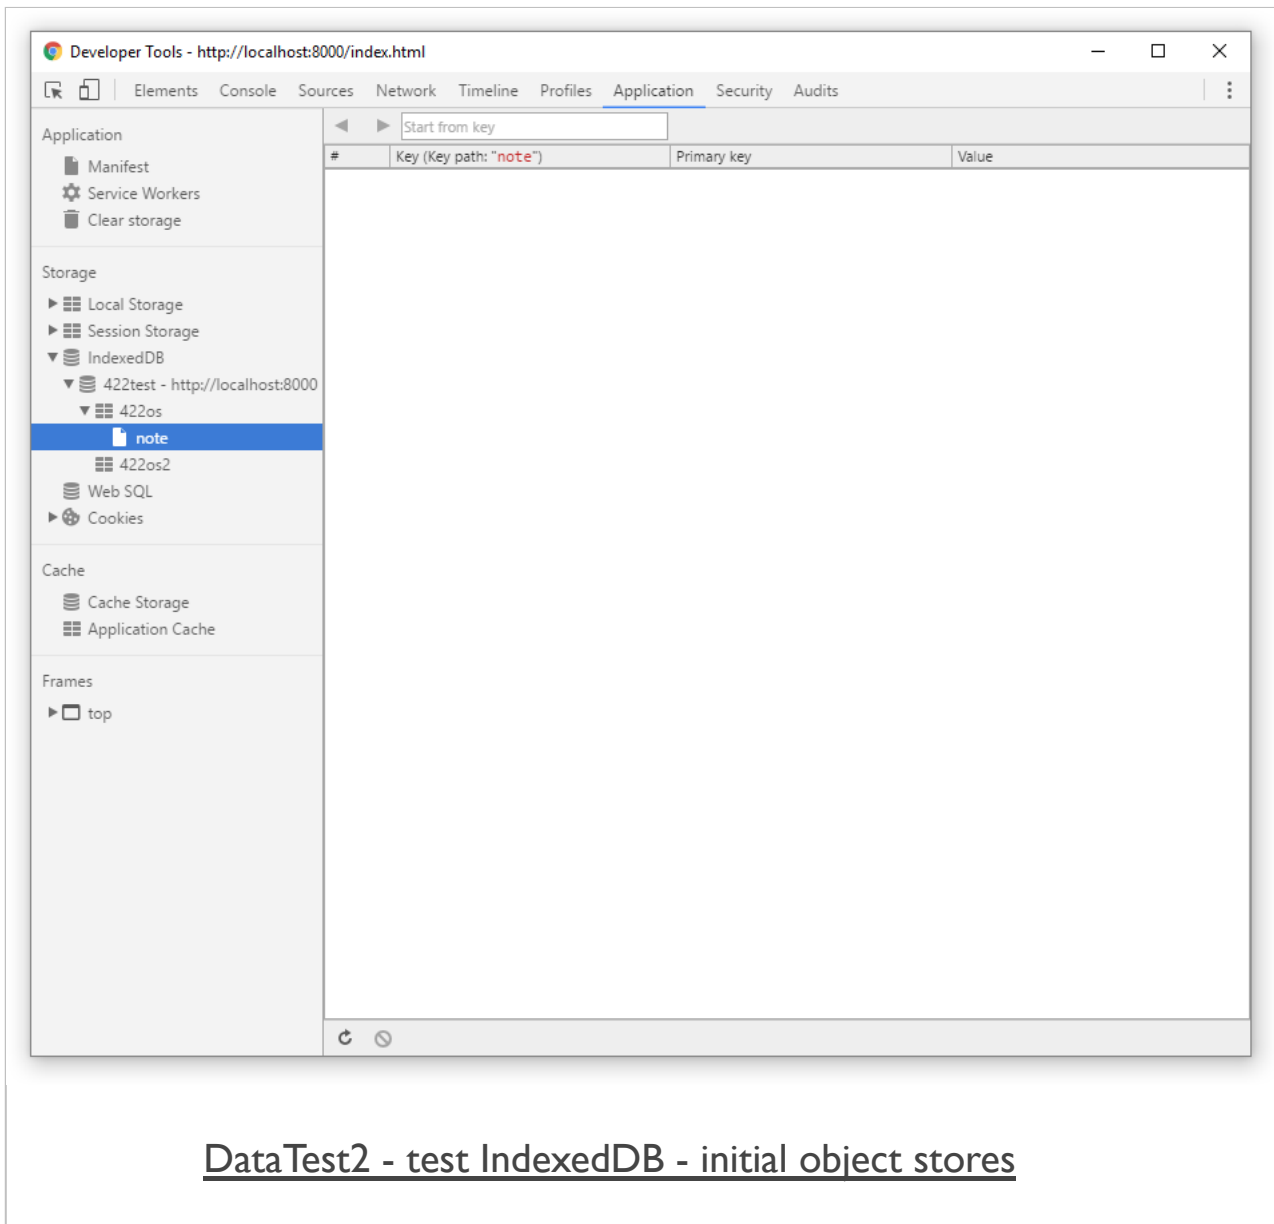

Cordova app - IndexedDB - data test 2

database - part 7 - extra data stores

- start to add further object stores
- can't simply create a new object store due to the `upgradeneeded` event
- increment the version number for the current database
 - *thereby invoking the `upgradeneeded` event*
- create our new object store using the same pattern

```
var openDB = indexedDB.open("422test",2);
openDB.onupgradeneeded = function(e) {
  console.log("DB upgrade...");
  //local var for db upgrade
  var upgradedDB = e.target.result;
  if (!upgradedDB.objectStoreNames.contains("422os")) {
    upgradedDB.createObjectStore("422os");
    console.log("new object store created...");
  }
  if (!upgradedDB.objectStoreNames.contains("422os2")) {
    upgradedDB.createObjectStore("422os2");
    console.log("new object store 2 created...");
  }
}
```

Image - IndexedDB Support

Cordova app - IndexedDB - data test 2

database - part 8 - add data

- our database currently has two object stores
 - *now start adding some data for our application*
- IndexedDB allows us to simply store our objects in their default structure
 - *simply store JavaScript objects directly in our IndexedDB database*
- use transactions when working with data and IndexedDB
- transactions help us create a bridge between our app and the current database
 - *allowing us to add our data to the specified object store*
- a transaction includes two arguments
 - *first for the object store*
 - *second is the type of transaction*
 - *choose either *readonly* or *readwrite**

```
var dbTransaction = db.transaction(["422os"], "readwrite");
```

Cordova app - IndexedDB - data test 2

database - part 9 - add data

- use transaction to retrieve object store for our data
 - *requesting the 422os in this example*

```
var dataStore = dbTransaction.objectStore("422os");
```

- add some data using the new dataStore

```
// note
var note = {
  title:title,
  note:note
}
// add note
var addRequest = dataStore.add(note, key);
```

- for each object we can define the underlying naming schema
 - *best fit our applications*
- then add our object, with an associated key, to our dataStore

Cordova app - IndexedDB - data test 2

database - part 10 - add data

- now added an object to our object store
- request is asynchronous
 - *attach additional handlers for returned result*
 - *add a success and error handler*

```
// success handler
addRequest.onsuccess = function(e) {
    console.log("data stored...");
    // do something...
}

// error handler
addRequest.onerror = function(e) {
    console.log(e.target.error.name);
    // handle error...
}
```

Cordova app - IndexedDB - data test 2

database - part II - add data

- add a form for the note content and title
- set a save button to add the note data to the IndexedDB

```
<form id="noteForm">
  <div class="ui-field-contain">
    <label for="noteName">Note Title</label>
    <input type="text" id="noteName" name="noteName"></input>
  </div>
  <div class="ui-field-contain">
    <label for="noteContent">Note Content</label>
    <input type="text" id="noteContent" name="noteContent"></input>
  </div>
  <div data-role="controlgroup" data-type="horizontal">
    <input type="button" id="saveNote" data-icon="action" value="Save Note" data-inline="true" />
  </div>
</form>
```

- bind event handler to save button for click
 - *submit add request to IndexedDB*
 - *store object data*

Cordova app - IndexedDB - data test 2

database - part 12 - add data handlers

- now add our event handler for the save button
- handler gets note input from note form
- passes the data to the `saveNote()` function

```
// handler for save button
$("#saveNote").on("tap", function(e) {
    e.preventDefault();
    var noteTitle = $("#noteName").val();
    var noteContent = $("#noteContent").val();
    saveNote(noteTitle, noteContent);
});
```

Cordova app - IndexedDB - data test 2

database - part 13 - add data handlers

```
//save note data to indexeddb
function saveNote(title, content){
    //define a note
    var note = {
        title:title,
        note:content
    }
    // create transaction
    var dbTransaction = db.transaction(["422os"], "readwrite");
    // define data object store
    var dataStore = dbTransaction.objectStore("422os");
    // add data to store
    var addRequest = dataStore.add(note,1);
    // success handler
    addRequest.onsuccess = function(e) {
        console.log("data stored...");
        // do something...
    }
    // error handler
    addRequest.onerror = function(e) {
        console.log(e.target.error.name);
        // handle error...
    }
}
```

Image - IndexedDB Support

IndexedDB supported...	plugin.js:17
DB upgrade...	plugin.js:26
new object store created...	plugin.js:31
new object store 2 created...	plugin.js:35
DB success...	plugin.js:39
data stored...	plugin.js:66

DataTest2 - test IndexedDB - save data to store

Image - IndexedDB Support

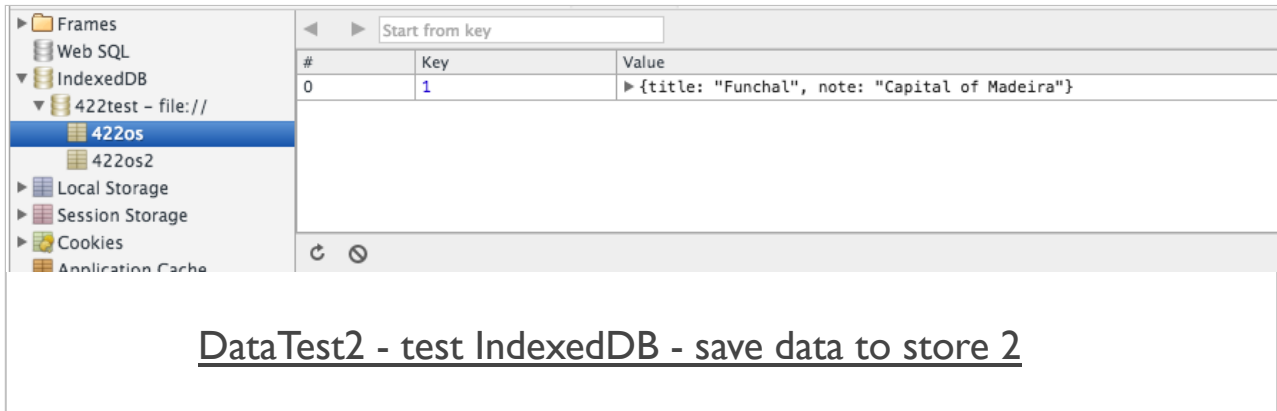

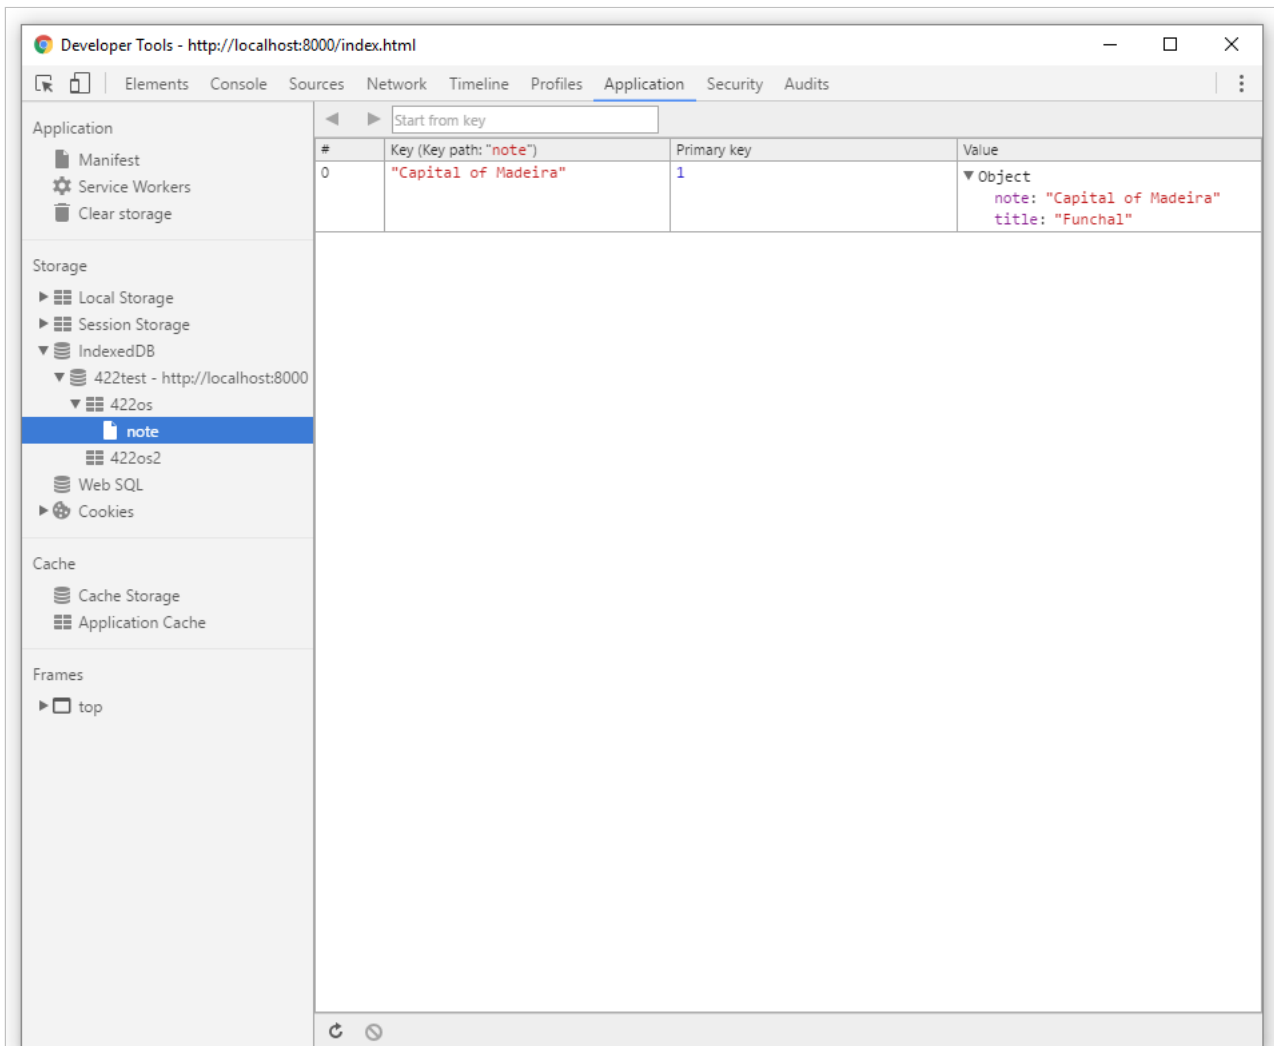

Image - IndexedDB Support

DataTest2 - test IndexedDB - save data to store 3

Cordova app - IndexedDB - data test 2

database - part 14 - multiple notes

- now created our IndexedDB
- created the object store
- setup the app's HTML and form
- and saved some data to the database...
- update our application to allow a user to add multiple notes to the database
- currently setting our key for a note in the `saveNote ()` function
 - *add another note, we get a constraint error output to the console*
 - *we're trying to add a note to an existing key in the database*
- need to update our logic for the app
 - *to allow us to work more effectively with **keys***

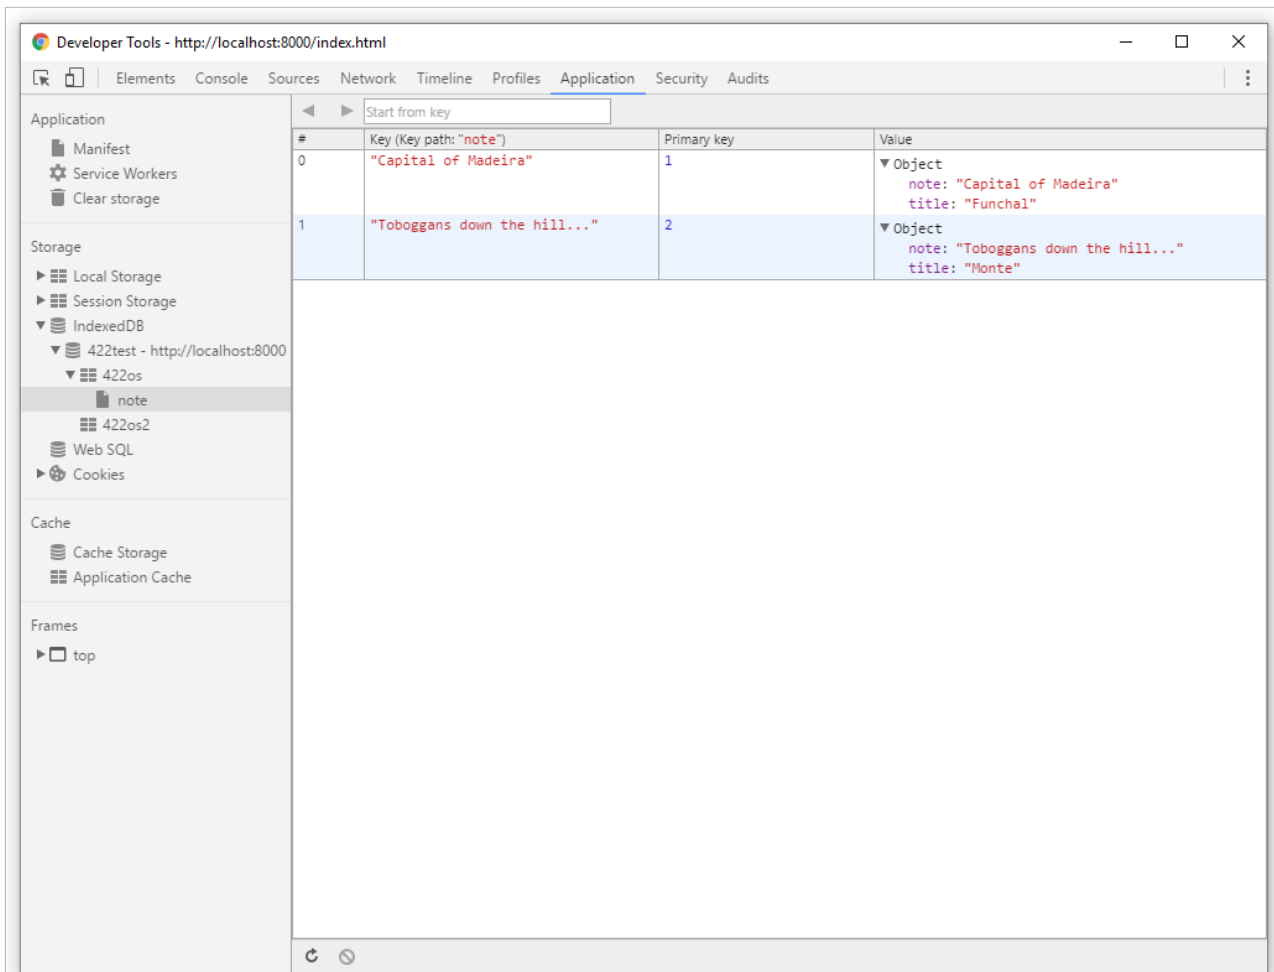

Cordova app - IndexedDB - data test 2

database - part 15 - keys

- keys in IndexedDB often considered similar to primary keys in SQL...
 - *a unique reference for our data objects*
- traditional databases can include tables without such keys
 - **NB:** every object store in IndexedDB needs to have a **key**
 - *able to use different types of keys for such stores*
- first option for a key is simply to create and add a key ourselves
 - *could programatically create and update these keys*
 - *helps maintain unique ID for keys*
- could also provide a **keypath** for such keys
 - *often based on a given property of the passed data...*
 - *still need to ensure our key is unique*
- other option is to use a key generator within our code
 - *similar concept to SQL auto-increment*

```
db.createObjectStore("422os", { autoIncrement: true });
```

Image - IndexedDB Support
